(57) **ABSTRACT**

A compliance monitoring module for a breath-actuated
inhaler comprising: a miniature pressure sensor, a sensor
port of said sensor being pneumatically coupled to a flow
channel through which a user can inhale; a processor con-
figured to: receive a signal originating from a dosing mecha-
nism of the inhaler indicating that medication has been
released; receive data from a sensing element of the sensor;
and based on said signal from said dosing mechanism and
said data from said sensing element, make a determination
that inhalation of a breath containing medication through
said flow channel complies with one or more predetermined
requirements for successful dosing; and a transmitter con-
figured to, responsive to said determination, issue a dosing
report.
